

Prezygotic Barriers : 0 fitness barriers

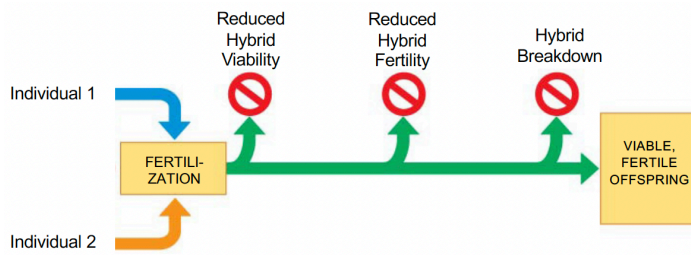

- Habitat Iso :
 - Geo : Oxbow river
 - Eco : Fish moving to diff part of eco to survive
- Temporal Iso :
 - Fly reproduce during Apple/Berry Season only
 -
- Behavioral Iso : (traits + ritual dependant)
 - Panama Shrimp were habitat ISO'd for a while so now they only prefer to mate w/ Shrimp of specific color
 - Fireflies use unique flashing patterns to attract mates ;
- Mechanical Iso
 - Genital Structures must match
 - Coil snails must match (sign of compatibility)
- Gametic Iso :
 - Sperm + Egg cannot fuse successfully
 - Sea Urchins splooging eggs/sperm but only same urchin species will be compat

Imperfect Barriers :

- Iso Barriers reduce mating but not 100 % guarantee
- East/West monarch butterflies migrate diff dir ea year
 - ↳ Meaning they rarely have the opportunity to mate
 - ↳ But occasionally overlap locations in Mexico allowing interbreeding

Post-Zygotic : (-) Offspring reproduction, post fertilization

- Reduced Hybrid Viability
 - Hybrid Offspring fail to develop; die young; don't make to adulthood
 - Ex) Yellow frogs mate occasionally
 - ↳ But their embryos stop dev and die in a day
 - Ex) F1 Hybrid Butterflies are attacked/targeted by birds
 - ↳ Possibly due to a pheno trait making them stand out
- Reduced Hybrid Fertility:
 - Hybrids become adults; Parents had diff chromosome arrangements; They are sterile;
 - Mules are perfect examples
- Hybrid Breakdown:
 - F1 Hybrid are healthy/fertile; Problems appear in later gens
 - F1 x F1 are weak, sterile or die
 - Allelic Complications come from the fact that ea hybrid accumulated diff mutations over time
 - Ex) Hybrid Fishes w/ Pigmentation genes
 - ↳ Mutations control if it produces pigment + one controls size
 - ↳ w/o regulatory control spots can become malignant and kill them
 - ↳ overtime these mutation incompat 'break down' the species.
